

# System State

Welcome to the System State Protocol - Unlock sustainable yield with smart contract vaults

Our protocol employs meticulous incremental strategies and precise ratios to ensure that every deposit results in gains. By securely locking up tokens in our smart escrow vaults, we guarantee consistent, long-term profits for our users. Leveraging the power of natural market forces and entropy, our protocol generates sustainable and reliable yields, enabling you to grow your crypto assets for years to come.

System-State Protocol is the missing piece in safeguarding your cryptocurrency assets. In a high-risk crypto market, protecting your assets is paramount. Rest assured, all our smart contracts will be renounced and devoid of admin keys, ensuring your financial security.

### How It Operates

Our sophisticated smart contracts implement a combination of incremental strategies and precise ratios to continually generate profits with each deposit. The primary function is to securely lock tokens in escrow vaults, guaranteeing steady long-term gains.

### Delving Deeper

At the core of our system are the Incremental Price Targets (iPTs) and Ratio Price Targets (rPTs) which are established by leveraging Fibonacci ratios on 61.8% of the initial deposit, resulting in an impressive 58% gain. Additionally, 26.30% of the deposit is reserved within an escrow vault contract, ensuring consistent payouts upon the token's attainment of a 1X gain.

### An Illustration

Consider the scenario where you deposit \$1000 and receive a return of \$1580 while still having 26.30% secured within the escrow vault. Whenever the token's price experiences a 1X increase, you'll receive the corresponding value of your escrow funds. If the token's value skyrockets by 250X, you'll be entitled to your escrow funds' value a remarkable 250 times over. This approach serves as an ultimate means of protecting your cryptocurrency assets. Furthermore, the smart contract targets the return of your original token amount while securing 26.30% in the escrow vault.

What is the ultimate game theory in crypto?

Users holding the \$State token share the 4,75% protocol fees and receive rewards from every token on each chains. This means \$State token holder will receive rewards in all the gas token from each chain such as Eth, BNB, Matic, Avax, Fantom, Tron, Evmos, Moonbeam, Pulsechain, Optimism, Arbitrum and of course the upcoming X1 chain. Holding the \$State token is the only requirement to receive protocol fee rewards.

Escrow Vaults will be available on

- Base
- Binance Smart Chain
- Tron
- Polygon
- Avalanche
- Fantom
- Optimism
- Arbitrum
- Moonbeam
- Evmos
- Pulsechain
- X1
